

# Automox and Reporting Your Environment

Automox has reporting available for you to view and download. Included are our activity log, overview report, needs attention, pre-patch report, and data extract.

The **activity log** provides logging and reporting on system events such as policy actions and patch actions.

The **overview report** provides a device overview, a history of patches applied, and outstanding patches with their aging. This report is designed to be shared with executives and provides a current snapshot of your overall systems vulnerability.

The **pre-patch report** shows you a list of all the pending patches per endpoint along with severity and exposure information allowing you to effectively assess internal impact. While the **needs attention report** gives you a list of endpoints that need attention along with the relevant information, so you can focus on specific systems issues, saving valuable time and resources.

A **data extract** provides data such as historical patching activity and audit logs for devices.

You can access these reports by clicking **View**.
