Release Notes for Week Ending 07/16/2021

Enhancements

- Updated the Policies table to support new flexible device targeting feature. Policies with device targeting will no longer show a device count in the table but will still link to the devices page with the policy filter applied so the user can view impacted devices.
- Updated the prepatch report to display devices which match the flexible device targeting definitions of associated policies.
- All device tables will display devices first private IP address in the table cell when a private IP is available. Additional IP addresses are shown in a popup menu and are now labelled as public or private.

Bug Fixes

- Bug fix: A defect was temporarily released that hid policies on the manage policies page if there were more than 25. This is now fixed.
- Fixes bug detecting CentOS 8.3 at install time.
