

Understanding Global Zone Management

Global zone management allows a Global Administrator of a company's IT infrastructure to manage all zones (formerly organizations) and users from a centralized Global View.

A global administrator has exclusive access to the **Global View** configuration pages. Zone administrators (formerly Full administrators) and other administrator accounts do not have access to the Global View.

Global Administrators have the following permissions:

- They can view all users for all zones
- Manage: add, modify, and remove zones and users
- The Global Administrator has full administrator permissions for all zones tied to an account

For more information about the global administrator role, refer to [Roles and Permissions](#).
